

## And You Thought the GRF2501 Was Impressive?

The [GRF2501](#) is a world-class WLAN low noise amplifier, but there is a new product that extends our WLAN dominance - the [GRF2101](#). It offers higher gain, lower NF, better linearity and *lower cost*. The [GRF2101](#) only requires 1 resistor to set the desired  $I_{ddq}$ , and 3 capacitors to provide DC blocking, matching and bias de-coupling.

Take a look at the performance of the [GRF2101](#) below. With the device biased at 3.3 V and 18 mA, noise figure and gain truly shine.

The [GRF2101](#) is pin compatible with the [GRF2501](#) in an industry-standard 1.5 x 1.5 mm DFN-6 plastic package. Evaluation boards are available now, so click on the button below to order one today!
